

PART 01:

1. Create a new class called 'Item' with two protected instance variables (private variables), an integer variable called 'location', and a String variable called 'description'.

```
public class Item {  
    private int location;  
    private String description;  
}
```

2. Add a constructor method for the Item class that takes an integer and a String as arguments (in that order).

```
public Item(int a,String b){}
```

3. The constructor should assign the value of these parameters to the corresponding instance variables.

```
public Item(int a,String b)  
{  
    location=a;  
    description=b;  
}
```

4. Add getter and setter methods for the location and description variables.

```
public void setLocation(int location)  
{  
    this.location=location;  
}  
public void setDescription(String description)  
{  
    this.description=description;  
}  
public int getLocation ()  
{  
    return location;  
}  
public String getDescription()  
{  
    return description;  
}
```

5. Add another class called Monster and make the Monster class a sub-class of the Item class.

```
public class Monster extends Item{}
```

6. Add a constructor method to the Monster class that takes an integer and a String argument just like the Item class constructor.

```
public class Monster extends Item{
    public Monster(int location, String description) {
        super(location, description);
    }
}
```

- Use these arguments to call the Item super class constructor from within the Monster class constructor so that the instance variables in the superclass are instantiated correctly.

```
public static void main(String[] args) {  
    Monster m=new Monster(1234,"Cargo");  
    m.setLocation(1234);  
    m.getLocation();  
    m.setDescription("Cargo");  
    m.getDescription();  
}
```

PART 02

1. Which of these keywords is used to refer to member of base class from a sub class?

a) upper **b) super** c) this d) None of the mentioned

3. The modifier which specifies that the member can only be accessed in its own class is a)

public b) private **c) protected** d) none

4. Which of these is a mechanism for naming and visibility control of a class and its content?

a) Object **b) Packages**
c) Interfaces d) None of the Mentioned.

5. Which of the following is correct way of importing an entire package 'pkg'?
- a) import pkg.
 - b) Import pkg.
 - c) import pkg.***
 - d) Import pkg.*
6. Which of these method of class String is used to extract a single character from a String object?
- a) CHARAT()
 - b) charat()
 - c) charAt()**
 - d) CharAt()
7. Which of these method of class String is used to obtain length of String object?
- a) get()
 - b) Sizeof()
 - c) lengthof()
 - d) length()**

PART 03: Fill in the blanks using appropriate term.

1. Real-world objects contain **state** and **behavior**.
2. A software object's state is stored in **instance variables**.
3. A software object's behavior is exposed through **methods**.
4. Hiding internal data from the outside world, and accessing it only through publicly exposed methods is known as data **encapsulation**.
5. A blueprint for a software object is called a **class**.
6. Common behavior can be defined in a **base class** and inherited into a **sub class** using the **extends** keyword.
7. A collection of methods with no implementation is called an **interface**.
8. A namespace that organizes classes and interfaces by functionality is called a **package**.
9. The term API stands for? **Application Programming Interface**.
